

NEXUS-R GitHub Release Package

Complete documentation suite for public repository release.

Files Included

File	Purpose	Paste To
README.md	Main repository landing page	nexus- <i>r</i> /README.md
CONTRIBUTING.md	Developer onboarding and standards	nexus- <i>r</i> /CONTRIBUTING.md
ROADMAP.md	Phase-by-phase development plan with kill criteria	nexus- <i>r</i> /ROADMAP.md
ARCHITECTURE.md	Full subsystem design and data flow	nexus- <i>r</i> /ARCHITECTURE.md
GITHUB_PROFILE.md	Organization page bio, investor narrative, demo script	nexus- <i>r</i> /docs/GITHUB_PROFILE.md
NAMING_CONSISTENCY.md	File/class/function naming conventions	nexus- <i>r</i> /docs/NAMING_CONSISTENCY.md
BENCHMARK_STYLE.md	Performance reporting methodology and templates	nexus- <i>r</i> /docs/BENCHMARK_STYLE.md

Quick Start for Release

1. **Copy files** to your repository root and docs/ directory
2. **Customize** README.md — replace yourorg with actual GitHub org name
3. **Add badges** — link to actual CI status once GitHub Actions is running
4. **Verify links** — ensure all internal links (./ARCHITECTURE.md, etc.) resolve
5. **Commit** as docs: add GitHub release documentation suite

Tone Checklist

Before releasing, verify every document against these rules:

- No “AGI” or “superintelligence” claims
- No “revolutionary” or “game-changing” adjectives
- Every performance claim has methodology
- Every “complete” claim has honest limitations listed
- Mock/fallback systems are labeled as such
- BYOK unverified status is disclosed
- Phase 2 is marked “next”, not “coming soon”
- Kill criteria are stated explicitly
- Security audit reports are referenced
- Runtime truthfulness report is linked

What This Package Achieves

Goal	How Addressed
Serious systems-engineering project	Architecture.md, event-sourcing design, subsystem isolation
Early-stage infrastructure startup	Roadmap with phase gates, investor narrative, demo script
Technically credible	Benchmark style guide, reproducible commands, honest limitations
Investor/demo ready	GitHub profile with demo script, performance targets, kill criteria
Contributor friendly	Contributing.md with agent-native methodology, naming guide, test standards
No fake claims	Runtime truthfulness report referenced, mock systems labeled, BYOK unverified disclosed

Suggested Next Steps

1. **Codex task:** Apply naming consistency to existing codebase (rename files, classes, functions per NAMING_CONSISTENCY.md)
2. **You:** Get Groq API key, validate BYOK fallback, update truthfulness report
3. **Codex:** Write tests/stress/test_concurrency_100.py per benchmark style
4. **You:** Record 2-minute demo video showing `nexus run → history → cost`
5. **Both:** Review all docs for org name, email, and link accuracy before making public

The documentation is now as operationally honest as the runtime.
